

Ashikhmin Shirley 2000 - Anisotropic phong reflectance model

- R_s : a color (RGB) that specifies the specular reflectance at normal incidence.

- R_d : a color (RGB) that specifies the diffuse reflectance

- n_u, n_v : two phong-like exponents that control the shape of the specular lobe

The model is a classical sum of a "specular" term and a "diffuse" term.

$$R_s = 0.4 \quad (1)$$

$$R_d = 0.9 \quad (2)$$

$$n_v = 1.5 \quad (3)$$

$$n_u = 300 \quad (4)$$

The specular component ρ_s of the BRDF is:

$$n = \vec{n} \quad (5)$$

$$h = \vec{h} \quad (6)$$

$$\text{normalize}(\vec{u}) = \frac{\vec{u}}{\sqrt{\vec{u} \cdot \vec{u}}} \quad (7)$$

Tangent vector:

$$u = \text{normalize}(0, \vec{1}, 0 \times n) \quad (8)$$

Bitangent vector:

$$v = \text{normalize}(\vec{n} \times u) \quad (9)$$

$$k = \vec{\omega}_i \quad (10)$$

$$\rho_s(\vec{\omega}_i, \vec{\omega}_o) = \frac{\sqrt{(n_u + 1) * (n_v + 1)}}{8 * \pi} * \frac{(n \cdot h)^{\left(\frac{n_u * (h \cdot u)^2 + n_v * (h \cdot v)^2}{1 - (h \cdot n)^2}\right)} * F(k \cdot h)}{(h \cdot k) * \max((n \cdot \vec{\omega}_i), (n \cdot \vec{\omega}_o))} \quad (11)$$

$$\rho_d(\vec{\omega}_i, \vec{\omega}_o) = \frac{28 * R_d}{23 * \pi} * (1 - R_s) * \left(1 - \left(1 - \frac{(n \cdot \vec{\omega}_i)}{2}\right)^5\right) * \left(1 - \left(1 - \frac{(n \cdot \vec{\omega}_o)}{2}\right)^5\right) \quad (12)$$

$$F(x) = R_s + (1 - R_s) * (1 - (k \cdot h))^5 \quad (13)$$

$$f = \rho_s(\vec{\omega}_i, \vec{\omega}_o) + \rho_d(\vec{\omega}_i, \vec{\omega}_o) \quad (14)$$
